European Community Directive on the Conservation of Natural Habitats and of Wild Fauna and Flora (92/43/EEC)

Fourth Report by the United Kingdom under Article 17 on the implementation of the Directive from January 2013 to December 2018

Supporting documentation for the conservation status assessment for the species:

S6353 - Whitefish (*Coregonus lavaretus*)

SCOTLAND
IMPORTANT NOTE - PLEASE READ

• The information in this document is a country-level contribution to the UK Report on the conservation status of this species, submitted to the European Commission as part of the 2019 UK Reporting under Article 17 of the EU Habitats Directive.

• The 2019 Article 17 UK Approach document provides details on how this supporting information was used to produce the UK Report.

• The UK Report on the conservation status of this species is provided in a separate document.

• The reporting fields and options used are aligned to those set out in the European Commission guidance.

• Explanatory notes (where provided) by the country are included at the end. These provide an audit trail of relevant supporting information.

• Some of the reporting fields have been left blank because either: (i) there was insufficient information to complete the field; (ii) completion of the field was not obligatory; (iii) the field was not relevant to this species (section 12 Natura 2000 coverage for Annex II species) and/or (iv) the field was only relevant at UK-level (sections 9 Future prospects and 10 Conclusions).

• For technical reasons, the country-level future trends for Range, Population and Habitat for the species are only available in a separate spreadsheet that contains all the country-level supporting information.

• The country-level reporting information for all habitats and species is also available in spreadsheet format.

Visit the JNCC website, https://jncc.gov.uk/article17, for further information on UK Article 17 reporting.
### Report on the main results of the surveillance under Article 11 for Annex II, IV and V species (Annex B)

3.4 Hunting bag or quantity taken in the wild

Based mainly on expert opinion with very limited data

3.5 Additional information

No commercial or sporting (recreational) fishery exists for this eces in Scotland. Occasional reports of angler caught fish are received, although these fish, protected under Schedule 5 of the Wildlife & Countryside Act 1981, are returned.

4. Biogeographical and marine regions

4.1 Biogeographical or marine region where the species occurs

Atlantic (ATL)

5.9 Long-term trend Method used
5.10 Favourable reference range

6. Population

6.1 Year or period
2017

6.2 Population size (in reporting unit)
a) Unit number of individuals (i)
b) Minimum 29661
c) Maximum 157025
d) Best single value 63222

6.3 Type of estimate
Best estimate

6.4 Additional population size (using population unit other than reporting unit)
a) Unit number of map 1x1 km grid cells (grids1x1)
b) Minimum

c) Maximum

d) Best single value 187

6.5 Type of estimate
Best estimate

5.5 Short-term trend Method used
5.6 Long-term trend Period
5.7 Long-term trend Direction
5.8 Long-term trend Magnitude
5.9 Long-term trend Method used
5.10 Favourable reference range

6.12 Long-term trend Direction
Increasing (+)

5.11 Change and reason for change in surface area of range
Genuine change
The change is mainly due to: Genuine change

5.12 Additional information
Favourable reference status must be the surface area of the two original sites - sites which are still occupied by whitefish in Scotland, Loch Lomond and Loch Eck (74.98 km²). The area occupied by whitefish in Scotland has increased by an additional 9.55 km² through the establishment of six additional refuge populations. This gives a total occupancy of 84.53 km².
Report on the main results of the surveillance under Article 11 for Annex II, IV and V species (Annex B)

6.13 Long-term trend Magnitude
- a) Minimum
- b) Maximum
- c) Confidence interval

6.14 Long-term trend Method used

6.15 Favourable reference population (using the unit in 6.2 or 6.4)
- a) Population size
- b) Operator
- c) Unknown
- d) Method

6.16 Change and reason for change in population size
- Genuine change

6.17 Additional information

7. Habitat for the species

7.1 Sufficiency of area and quality of occupied habitat
- a) Are area and quality of occupied habitat sufficient (to maintain the species at FCS)?
- b) Is there a sufficiently large area of occupied AND unoccupied habitat of suitable quality (to maintain the species at FCS)?
- Yes

7.2 Sufficiency of area and quality of occupied habitat Method used
- Complete survey or a statistically robust estimate

7.3 Short-term trend Period
- 2005-2017

7.4 Short-term trend Direction
- Stable (0)

7.5 Short-term trend Method used
- Complete survey or a statistically robust estimate

7.6 Long-term trend Period

7.7 Long-term trend Direction

7.8 Long-term trend Method used

7.9 Additional information

There are no long-term changes to the distribution of habitats occupied by native populations of whitefish - the two native populations of this species in Scotland (Loch Lomond and Loch Eck) remain extant and the area covered by these waterbodies has not changed. New populations of whitefish have been established at six locations since 1988 - Loch Sloy, Carron Valley Reservoir, Locan Shira, Allt na Lairige Reservoir, Loch Tarsan and Loch Glashan.

8. Main pressures and threats

#### 9.2 Main purpose of the measures taken

Expand the current range of the species (related to 'Range')

#### 9.3 Location of the measures taken

Only outside Natura 2000

#### 9.4 Response to the measures

Short-term results (within the current reporting period, 2013-2018)

#### 9.5 List of main conservation measures

Reduce/eliminate point pollution to surface or ground waters from agricultural activities (CA10)

Reduce diffuse pollution to surface or ground waters from agricultural activities (CA11)
### 10. Future prospects

#### 10.1 Future prospects of parameters

- **a)** Range
- **b)** Population
- **c)** Habitat of the species

#### 10.2 Additional information

**Whitefish** are present in lochs Lomond and Eck and healthy populations remain there. The introduction of ruffe to Loch Lomond (first found in 1982) presents a significant risk to the whitefish population there but it is currently absent from Loch Eck. Since 1988 whitefish have been established in six refuge sites, four of which used Loch Lomond to source its donor population. Further spread of ruffe and other non-native species (both non-native to the UK or to individual catchments/waterbodies) to new sites is now regulated by the Salmon and Freshwater Fish (Scotland) Act 2003. Water quality and the overall aquatic environment are protected through WFD-led domestic legislation. Whitefish are protected under Schedule 5 of the Wildlife & Countryside Act 1981 (as amended).

### 11. Conclusions

The 10km grid square distribution map is based on available species records within the current reporting period. For further details see the 2019 Article 17 UK Approach document.
Range Map

Figure 2: UK range map for S6353 - Whitefish (*Coregonus lavaretus*). Coastline boundary derived from the Oil and Gas Authority's OGA and Lloyd's Register SNS Regional Geological Maps (Open Source).
Open Government Licence v3 (OGL). Contains data © 2017 Oil and Gas Authority.

The range map has been produced by applying a bespoke range mapping tool for Article 17 reporting (produced by JNCC) to the 10km grid square distribution map presented in Figure 1. The alpha value for this species was 25km. For further details see the 2019 Article 17 UK Approach document.
Species name: Coregonus lavaretus Complex (6353)

<table>
<thead>
<tr>
<th>Field label</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.4 Distribution map; Method used</td>
<td>Native populations of whitefish (known as Powan in Scotland, Schelly in England and Gwyniad in Wales) only known from two waterbodies in Scotland - lochs Eck and Lomond. New populations were established in Carron Valley Reservoir and Loch Sloy during 1988-1990 using fish sourced from Loch Lomond. More recently, new populations have been established in Lochan Shira (2009 and 2010) and Allt na Lairige Reservoir (2009 and 2010) using Loch Lomond stock and Loch Tarsan (2010 and 2011) and Loch Glashan (2010 and 2011) using fish sourced from Loch Eck. Adams et al., (2014) provide details of the life stages and numbers of fish used to establish all of these translocated populations.</td>
</tr>
</tbody>
</table>

3.5 Additional information | No commercial or sporting (recreational) fishery exists for this species in Scotland. Occasional reports of angler caught fish are received, although these fish, protected under Schedule 5 of the Wildlife & Countryside Act 1981, are returned. |

Species name: Coregonus lavaretus Complex (6353) Region code: ATL

<table>
<thead>
<tr>
<th>Field label</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.3 Short term trend; Direction</td>
<td>In the last reporting cycle whitefish were present in four sites (two native populations in Loch Lomond and Loch Eck, and two introduced in Carron Valley Reservoir and Loch Sloy). Since that time, four new populations have been established (Lochan Shira, Allt na Lairige Reservoir, Loch Tarsan and Loch Glashan). Population surveys, using the methodology described in bean (2003) suggest that the trend in terms of range is therefore increasing - but this is for introduced whitefish populations - the native population range remains stable and unchanged.</td>
</tr>
</tbody>
</table>

6.2 Population size | Based on actual survey (Adams et al., 2017; Winfield & James, 2016; Winfield & Fletcher, 2008). Hydroacoustics (fish density) data were available for all sites with the exception of Loch Sloy. Although this site was sampled to confirm that whitefish were still present in 2017, population data from Winfield & Fletcher (2008) have been used to provide an estimate of abundance. |

6.8 Short term trend; Direction | The population trend is increasing; this trend is based on the number of populations in Scotland. This is a species with high interannual variability in number of individuals; single, one-off, surveys which report the actual number of individuals may not give a true representation of the population trend. |

7.9 Additional information | There are no long-term changes to the distribution of habitats occupied by native populations of whitefish - the two native populations of this species in Scotland (Loch Lomond and Loch Eck) remain extant and the area covered by these waterbodies has not changed. New populations of whitefish have been established at six locations since 1988 - Loch Sloy, Carron Valley Reservoir, Lochan Shira, Allt na Lairige Reservoir, Loch Tarsan and Loch Glashan. |
8.1 Characterisation of pressures/threats

C. lavaretus (powan) is naturally extant in two waterbodies in Scotland (lochs Lomond and Eck), and six additional refuge sites have been established. Of these, only one site (Loch Lomond) is currently under threat from non-native species - the ruffe. Invasive fish and plant species could also be a risk within other lakes where this species is present (either naturally or introduced). Fish introductions are controlled under legislation (Salmon and Freshwater Fisheries (Consolidation) (Scotland) Act 2003). Water quality, particularly issues which lead to sedimentation in spawning substrates, could constitute a further risk to all populations, although it is not considered to be a current issue in any of the Scottish sites. Climate change is an issue which affects all native freshwater fish species in Scotland - particularly because freshwater fish may have little or no access to alternative habitats.

8.3 Additional information

The key pressures for whitefish are climate change, competition and predation by introduced species and habitat quality (influenced by climate, water quality, sedimentation), macrophyte encroachment into littoral spawning areas and water abstraction (e.g. drawdown at inappropriate times (such as spawning and incubation) in populations established in reservoirs).

9.6 Additional information

Whitefish are present in lochs Lomond and Eck and healthy populations remain there. The introduction of ruffe to Loch Lomond (first found in 1982) presents a significant risk to the whitefish population there but it is currently absent from Loch Eck. Since 1988 whitefish have been established in six refuge sites, four of which used Loch Lomond to source its donor population. Further spread of ruffe and other non-native species (both non-native to the UK or to individual catchments/waterbodies) to new sites is now regulated by the Salmon and Freshwater Fish (Scotland) Act 2003. Water quality and the overall aquatic environment are protected through WFD-led domestic legislation. Whitefish are protected under Schedule 5 of the Wildlife & Countryside Act 1981 (as amended).

10.2 Additional information

The future prospects for powan are good for Loch Eck, but less so for Loch Lomond which is under pressure from introduced ruffe. However, the establishment of six refuge populations provides some security for the species in Scotland as a whole. Where possible the Loch Lomond population should be protected, both directly and through maintenance of essential habitats.
